Real stablecoin payments are growing, an estimated ~60% between businesses

~$400B

real-world stablecoin payments in 2025, about 60% between businesses◦

$350–550B

of the $28–62T moved in stablecoins in 2025 was real payments; the rest is mostly trading

The pain: some payments arrive wrong: too little, the wrong network, a fake token, or no invoice number.

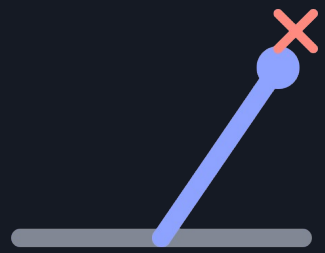

Someone has to match each one to its invoice and get it into the books by hand.†

~$400B, ~60% B2B (60% is Bessemer's estimate): Bessemer Venture Partners, Apr 2026. $350–550B of $28–62T: Reap, Aug 2026, citing BIS, BCG × Allium and McKinsey.
◦ estimate † my belief, not yet proven

Odd payments are explained, not chased

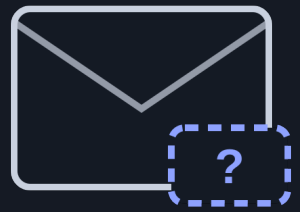

Paid a little too little

Sent the wrong way

Fake digital dollars

No invoice number

Without a tool: customers waiting, and the risk of accepting fake money.

Fake USDT (13) and wrong-network (6) payments appear in my tests on real transactions; short payments and missing references are demo cases. Frequency and time per case: not yet measured.
◦ estimate † my belief, not yet proven

What already exists, and what still looks manual

Big platforms
Stripe, Circle, Coinbase
→ **Becoming one-stop shops**

Crypto accounting tools
e.g. Bitwave, Request Finance
→ **Already sync to Xero, QuickBooks and NetSuite ✓**

A small business paid straight into its own wallet
→ **Wrong payments, and posting them correctly: still by hand †**

↑ A hypothesis I'm testing in calls

Bessemer Venture Partners, Apr 2026 (one-stop shops). Bitwave: bitwave.io · Request Finance: help.request.finance (both checked 28 Oct 2026).

Clearline · a project I'm exploring · Aashmiin Kaur, SMU

Stablecoin payments, matched, explained and in your books.

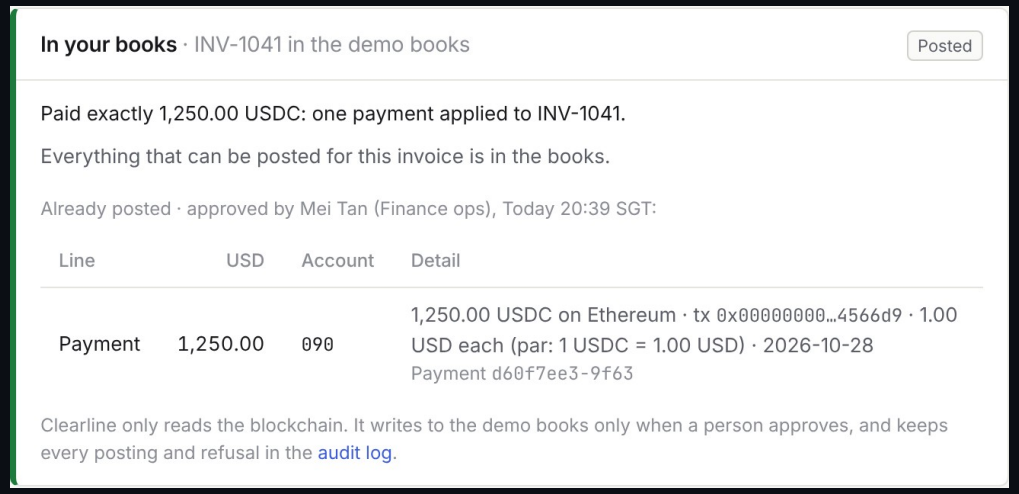

Clearline asks for each payment clearly, matches it to its invoice, checks it's genuine, explains anything that went wrong in plain English, and posts it to your accounting system when you approve.

① Ask
A payment page per invoice

② Match
Correct ones tick themselves off

③ Explain
Wrong ones explained, reply drafted

④ In your books
Posted to your books on approval (Xero first)

In your books · INV-1041 in the demo books — Posted

Paid exactly 1,250.00 USDC: one payment applied to INV-1041.

Everything that can be posted for this invoice is in the books.

Already posted · approved by Mei Tan (Finance ops), Today 20:39 SGT:

Line	USD	Account	Detail
Payment	1,250.00	090	1,250.00 USDC on Ethereum · tx 0x00000000…4566d9 · 1.00 USD each (par: 1 USDC = 1.00 USD) · 2026-10-28 Payment d60f7ee3-9f63

Clearline only reads the blockchain. It writes to the demo books only when a person approves, and keeps every posting and refusal in the audit log.

Step 4 in Clearline · demo mode, fictional company

Where it is today

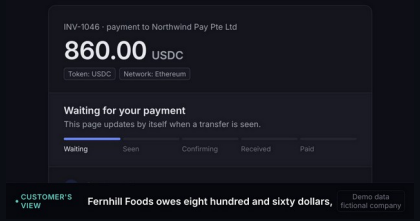

Xero connection built and checked in automated tests

Posting rules tested in demo mode (fictional company)

Next: first live test with Xero's demo company

Then QuickBooks; NetSuite on the roadmap

0 customers, working demo

▶ **60-second demo**

Film shows steps 1–3; step 4 coming in the next cut

The screenshot is Clearline's own panel, not Xero's. It reads payments only and never holds or moves money; it writes to the books only when a person approves.

It works in a demo. I don't yet know if people need it

What works

- 7 payment situations work end to end
- 52 of 52 real transactions: correct verdict[1]

What I don't know yet

- Do customers pay directly, or via checkout?
- Would finance teams use it?
- 0 customers; my 3 calls reached vendors only

[1] Real transactions it hadn't seen before (demo/REPORT.md). The invoice-matching part is not yet tested on real data.

Three questions I'd love your view on

1. Does the wrong-payments gap seem real to you?
2. What would you test first?
3. Is there anyone you'd suggest I speak to?

Thank you for reading.

Happy to show the demo in 15 minutes.
