Clearline: a project I'm exploring

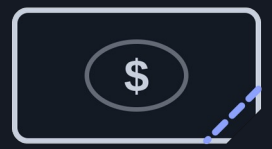

A smart cashier for digital-dollar (stablecoin) payments.

Shared for feedback and guidance

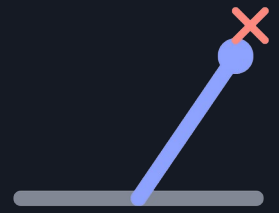

Aashmiin Kaur · Singapore Management University · October 2026

Payments arrive in seconds; checking can take hours◦

Maya, a finance manager, must work out which of these went wrong:

Paid too little

Wrong network

Counterfeit

No invoice number[1]

How I found it: exploring tools for crypto finance teams, I narrowed in on payments that don't match.

[1] A token transfer records sender, receiver and amount only: no invoice reference (ERC-20 standard, eips.ethereum.org/EIPS/eip-20). Maya is illustrative.

◦ estimate or assumption † untested unmarked = sourced

Stablecoin use is growing, and rules are arriving

Business use

About US$226B a year of business stablecoin payments, still ~0.01% of the total◦[1]

New rules

Singapore consulted on its stablecoin law, Sep–Oct 2026[2]

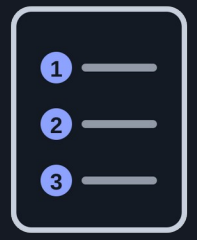

Singapore's role

One of the top five countries sending stablecoin payments[3]

[1] McKinsey with Artemis, 2026 (an estimate) [2] MAS consultation, 1 Sep 2026 (mas.gov.sg; Gibson Dunn) [3] Artemis, Oct 2025

To explore it, I built a smart cashier

1

The customer sees exactly how to pay

→

2

Correct payments tick themselves off

→

3

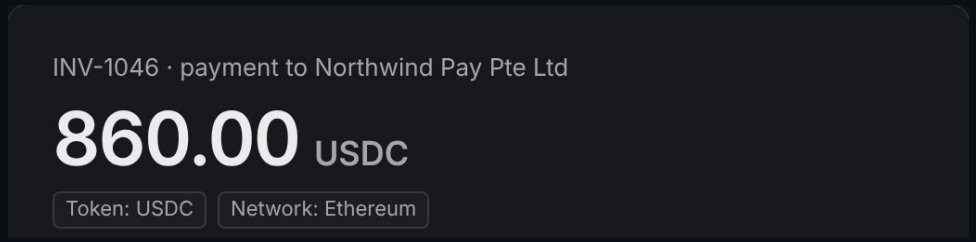

Problems are explained, with the reply drafted

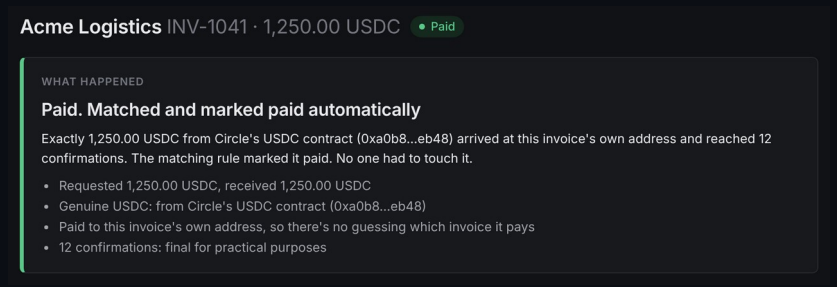

It reads payment information only; it never holds or moves money.

The working demo, on fictional data

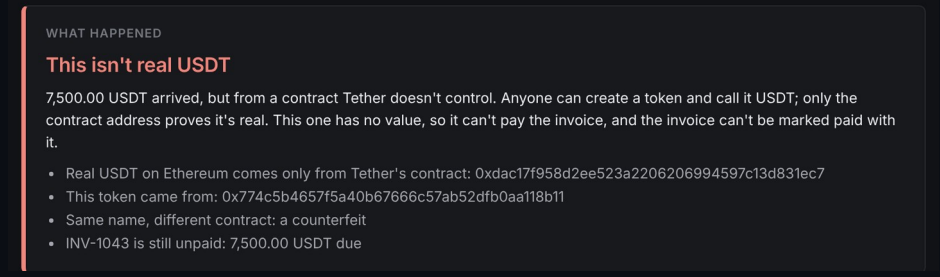

1 What the customer sees

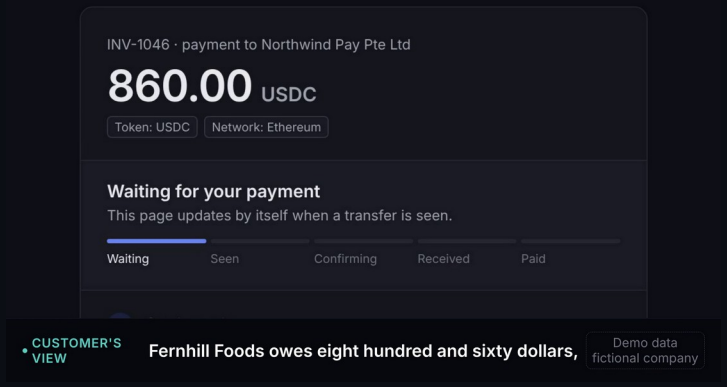

2 A correct payment, marked paid

3 A fake payment, explained

▶️ 60-second demo video

Plays in PowerPoint; also attached to my email

All data is fictional: the company, its customers and every amount.

Others already do much of this well

Stripe	Checkout and payment links
HitPay + Triple-A	Stablecoins for Singapore shops
Request Finance	Invoices, marked paid
Wallets	Warn senders of look-alike addresses
Blockaid	Flags scam tokens

Every piece exists somewhere. The gap that may remain: direct business payments and their exceptions◦. I'm not sure.

docs.stripe.com · fintechnews.sg · eco.com · KuCoin News · trustwallet.com · blockaid.io. Details in the speaker notes.
◦ estimate or assumption † untested unmarked = sourced

What I've learned: it works, but the need is untested

The demo handles 7 payment situations

52 of 52 new real transactions: correct verdict[1]

3 early calls, all with vendors: “not really an issue”

Not yet spoken to a finance team that receives stablecoins

0 customers

[1] demo/REPORT.md: held-out cases; the matching and explanations are not yet tested on real data. Calls: 16 Oct 2026, on an earlier version of the idea.

The four things I'm most unsure about

1. Do customers mostly use checkout pages, or pay directly?
2. A business, or a feature for payment companies?
3. Serve finance teams, or plug into payment companies?
4. What licensing applies to a read-only tool?

All four are open; I don't know the answers yet.

Where I'd value your guidance

1 **Does the direct-payment gap seem real to you?**

From what you've seen

2 **What would you test first, and how?**

The quickest way to learn

3 **Is there anyone I should speak to?**

Especially finance teams receiving stablecoins

Thank you for reading

Thank you for taking the time. Any reaction, however brief, would help me.

Happy to walk you through the demo in 15 minutes if useful

Appendix · Early thinking on the business side

Very rough, and none of it tested.

How it might earn

Fee per finance team, S$300–800/mo◦

Or per exception, via payment companies, S$1–3†

How big, Singapore only

300+ Web3 firms[1] × ~50% × S$6k ≈ S$0.9M a year ceiling◦

Main risks

Checkout tools may absorb it◦

Licensing unconfirmed

Solo, no payments experience
