Clearline

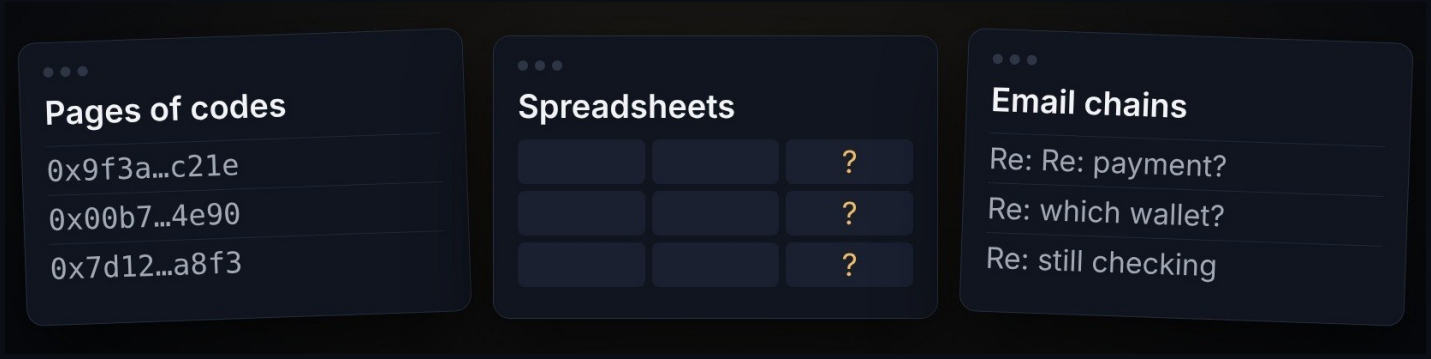

Get paid in digital dollars without the detective work.

Digital dollars: stablecoins such as USDC and USDT.

Working demo · seeking feedback

Aashmiin Kaur · Singapore Management University · October 2026

Paid in seconds. Checked for hours.

What a finance manager like Maya (illustrative) opens to find one payment [ASSUMPTION]

> “We paid INV-1043 in full yesterday. Please confirm and close the invoice.”
>
> Illustrative message · fictional demo company

Seconds to pay.
Hours to check. [ASSUMPTION]

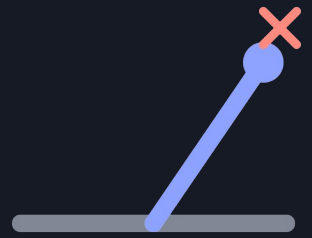

Ethereum adds a block about every 12 s (ethereum.org); receivers may wait minutes for confirmations. “Hours” is our assumption, to be tested in interviews.

Four things go wrong with these payments

A token transfer records sender, receiver and amount: no invoice reference.[1]

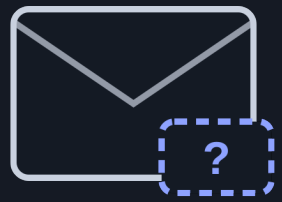

Paid a little too little

Sent on the wrong network

Counterfeit digital dollars

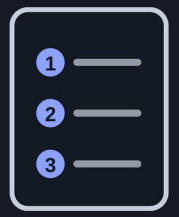

No invoice number

Today a person sorts out each one. How often each happens is what the interviews will measure. [ASSUMPTION]

[1] ERC-20 standard (eips.ethereum.org/EIPS/eip-20). Real cases in our tests include 13 fake-USDT and 6 wrong-network transfers (demo/REPORT.md).

A smart cashier for digital-dollar payments

It does the checking a finance person does today, and shows its work.

Customers know exactly how to pay

Amount, network and address on one page

Correct payments tick themselves off

Checked and marked paid automatically

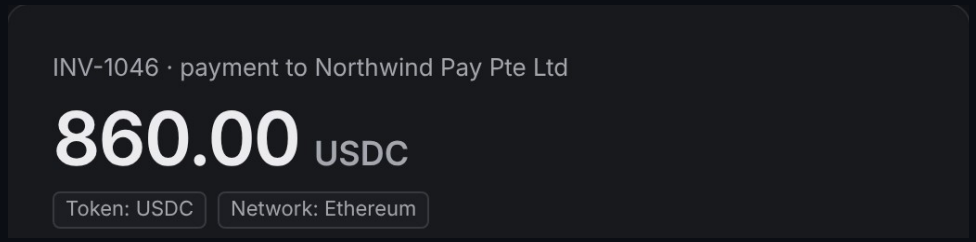

Problems explain themselves

The cause in plain English, and the reply drafted

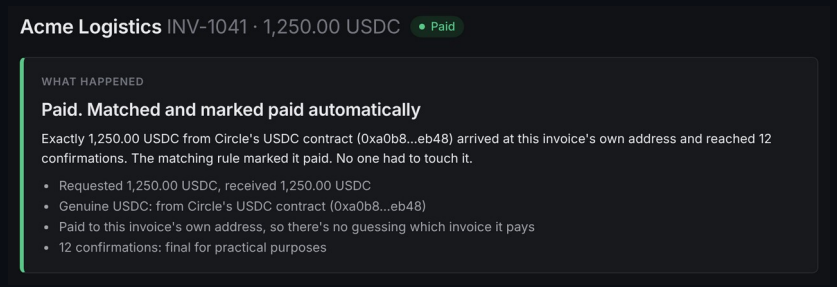

All three run in the working demo today, on fictional data. Clearline reads payments; it never holds or moves money.

The working demo

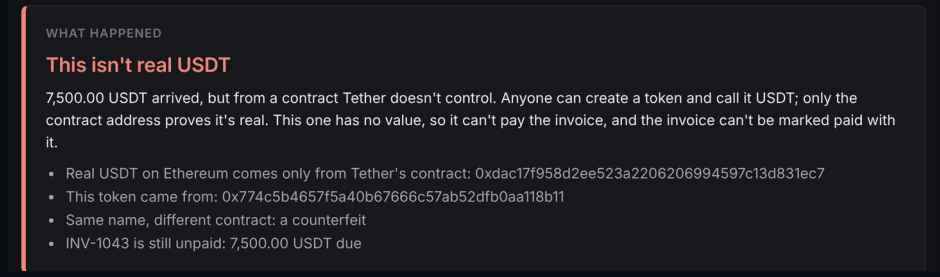

1 The customer sees exactly what to send, and where

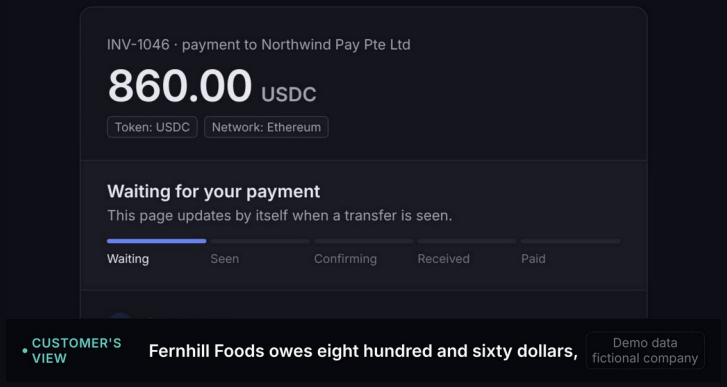

2 A correct payment marks itself paid

3 Fake digital dollars, explained in plain English

Full 2-minute walkthrough: demo_live_full.mp4

Real screenshots and a real recording of the app in demo mode. All companies, people and amounts are fictional.

Why now: rules, money and rails are arriving

Rules

US GENIUS Act signed, 18 Jul 2025 [1]

MAS consulted on stablecoin law changes, Sep–Oct 2026 [2]

Business use

~US$226B a year of business stablecoin payments: an estimate, ~0.01% of B2B payments [3]

Singapore: a top-5 sender of stablecoin payments [4]

Gateways

Stripe: US, EU/HK in preview; not Singapore; USDC, max US$10k [5]

HitPay + Triple-A: offered to 20,000+ Singapore merchants [6]

1 eco.com GENIUS tracker · 2 mas.gov.sg, Gibson Dunn · 3 McKinsey, 2026 (with Artemis) · 4 Artemis, Oct 2025 · 5 docs.stripe.com, Oct 2026 · 6 fintechnews.sg

First customer: teams paid directly

Not through a checkout page, which already handles its own payments

Through a checkout page	Customer clicks a payment link	Gateway matches it	Handled within their limits: Stripe, HitPay [ASSUMPTION]
Direct transfer	From an exchange account or company wallet	To a fixed address, any network	**Exceptions land on a person → Clearline [ASSUMPTION]**

Start: Singapore crypto and Web3 firms that invoice other businesses in USDC/USDT [ASSUMPTION]
EDB counts 300+ Web3 companies[1]; MAS licenses 37 token providers[2]. How many are paid in stablecoins: unknown.

[1] Singapore EDB, “Singapore: the onchain state” (undated; counting method not stated) · [2] fintechnews.sg, 6 Aug 2026 (parliamentary reply)

The gap I believe exists: direct payments

Every piece exists somewhere. What each does well, and what it leaves to a person.

Who	Does well	Leaves to a person [ASSUMPTION]
Checkout pages Stripe, Coinbase Commerce, Request Finance, HitPay	Match payments made through their page	Payments sent straight to an address
Wallet warnings MetaMask, Trust Wallet, Safe + Blockaid	Warn the sender about look-alike addresses	The invoice, and the receiving side
Risk and compliance Blockaid, Elliptic, Chainalysis	Flag scam tokens and risky addresses	“Which invoice is this, and what do I reply?”
Crypto accounting Bitwave, Request Finance	Books, ERP sync, payouts	Investigating each exception
Clearline working demo, fictional data	Explains 7 payment situations, with the reply drafted	No customers; matching untested on real data

Not yet compared: TRES Finance, Cryptio. Elliptic and Chainalysis described from general knowledge. Sources: docs.stripe.com · eco.com · fintechnews.sg · KuCoin News · trustwallet.com · blockaid.io · bitwave.io

What I believe that others may not

1. Business customers often pay from exchange accounts and company wallets, not checkout pages. [ASSUMPTION]

2. The cost is in the exceptions: each one is a 15–30 minute investigation. [GUESS]

3. Gateways would rather plug in exception handling than build it. [ASSUMPTION]

None of these is tested yet. Three early calls with vendor teams, on an earlier idea, found reconciliation “not really an issue” for them; buyer teams are untested.

Business model: two hypotheses, both untested

Direct

Monthly subscription per finance team, priced by payment volume

S$300–800 / month
[ASSUMPTION]

Embedded

A gateway or custodian pays per exception handled for its merchants

S$1–3 / exception [GUESS]

Test: ask 10 teams what one exception costs them today, in staff time.

Prices are placeholders for interviews, not quotes.

Market: start small and countable

300+

Web3 companies in Singapore[1] [VERIFIED]

× ~50%

invoice businesses that pay them directly in stablecoins [GUESS]

× S$6k

a year per finance team [ASSUMPTION]

S$0.9M

a year if every one bought: a ceiling for a test market [ASSUMPTION]

Next, sized only after interviews: Southeast Asia and India, and gateways' merchants through the embedded model.

[1] Singapore EDB, “Singapore: the onchain state”, edb.gov.sg. The other three figures are estimates; no top-down market size is claimed.

Traction: a working product, no customers yet

7
payment situations
run end to end in the demo

Not yet
invoice-matching accuracy
measured on real data[1]

3
early calls, all with
vendor teams[2]

0
customers or
paid pilots

Next: 10 finance teams that receive stablecoins, one question

“Do customers pay through a checkout page, or send directly?”

Mostly directly → sell to finance teams. **Mostly checkout** → become a plug-in for gateways.

[1] The checking engine is tested on recorded real public transfers; invoice-matching accuracy will be measured on 20 replayed real transfers (not yet measured). Explanations not yet tested on real data. [2] Custodian and compliance-software teams, 16 Oct 2026, earlier idea.

Team

AK

Aashmiin Kaur

Founder · builds the product and talks to customers

Year 2, Bachelor of Accountancy, Singapore Management University

Self-taught coder (Harvard CS50); built Clearline's working product myself, with AI coding tools

Business development: student analyst, Protégé Ventures; partner outreach, Hatch

SMU BIG incubator

Missing: payments operations experience. That's what I'm asking mentors for.

Founder's own background.

What I'd value from you

1 **Honest feedback on the wedge**

Are direct payments and their exceptions really underserved?

2 **3–5 introductions**

Finance teams that receive stablecoin payments, for a 20-minute conversation

3 **Advice on gateways**

Whether and how to partner with gateways or custodians

Aashmiin Kaur aashmiin@gmail.com · linkedin.com/in/aashmiin-kaur-479665391

Appendix · Risks and open questions

Checkout tools absorb the problem	Interview test on slide 12; if so, become a plug-in for gateways [ASSUMPTION]
Licensing	Read-only: never holds or moves money. Confirm with a Singapore lawyer [ASSUMPTION]
Data access	Start with public blockchain data plus an invoice export; integrations later [ASSUMPTION]
A wrong match	Never matches on a guess; a person confirms with a note [VERIFIED in the demo; untested on real data]
Solo founder	Find a co-founder with payments operations experience [ASSUMPTION]

Appendix · Hard questions: a YC partner

You haven't spoken to an actual buyer. How do you know anyone has this problem?
I don't yet. Vendors said it isn't an issue for them; my next ten calls are finance teams that receive stablecoins.

Your own market estimate is S$0.9M. Why is this venture-scale?
It isn't proven. Singapore is a test market; the region and the gateway route get sized once interviews give exception counts.

Why won't Stripe, HitPay or Circle just build this?
They might. If buyers mostly pay through checkout pages, I'll build the plug-in for gateways instead of competing.

Why you: a solo second-year student with no payments experience?
I built a working product and I'm trained on the finance side. I lack payments operations experience, and I'm looking for it.

What does your real-data test actually prove?
The checks are tested on recorded real public transfers. Invoice-matching accuracy isn't measured yet; we'll measure it on 20 replayed real transfers.

Appendix · Hard questions: a payments expert

A unique deposit address per invoice fixes missing references, and your demo uses one. What's left?
Payments that ignore the instructions: short, wrong network, fake tokens, old addresses. How common they are, I don't know yet.

Crypto accounting tools already reconcile on-chain payments to invoices. How are you different?
They match and book; I focus on investigating exceptions and drafting the reply. I haven't tested whether that difference matters.

Singapore's likely buyers are licensed crypto firms with compliance tools. Why buy another?
Maybe they won't. My three vendor calls said much the same. The buyer I need to test is the finance team receiving invoices.

Who is liable if it marks a fake or frozen payment as paid, and do you need a licence?
A person confirms anything non-routine, and fakes can't be marked paid. It never holds money; a lawyer must confirm licensing.

How many exceptions does a team see a month, and what does one cost?
I don't know. My 15–30 minutes is a guess; I'll ask ten teams for monthly counts and the staff time each takes.
