# Getting paid in digital dollars is like cash through the letterbox, with no note

no note

> “We paid yesterday. Why is our invoice still unpaid?”
>
> A customer, to Maya, a finance manager (fictional)

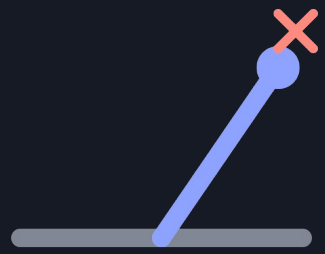

A bank transfer says which invoice it pays. A digital-dollar payment says nothing, so Maya has to find out.

Digital dollars = stablecoins (e.g. USDC, USDT). A digital-dollar transfer records sender, receiver and amount only (ERC-20 standard).

# Every odd payment means detective work

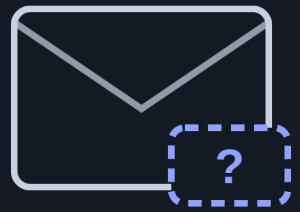

**Paid a little too little**

**Sent the wrong way**

**Fake digital dollars**

**No invoice number**

The cost: hours lost◦, customers waiting, and the risk of accepting fake money.

All four appear in my tests on real transactions (e.g. 13 fake-USDT, 6 wrong-network). How often they happen, and how long each takes, are not yet measured.
◦ estimate † my belief, not yet proven

# Checkout pages solve it, but only when customers use them

**A** **Pays through a checkout page**
e.g. Stripe, HitPay → **Handled ✓**

**B** **Sends directly from their own account** → **Nobody explains the mess ×**

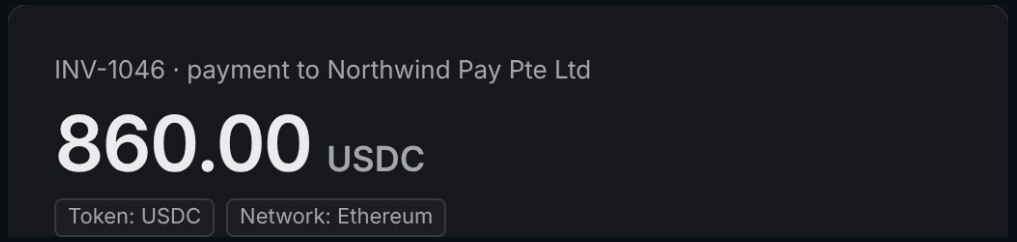

← The gap I'm exploring

Wallets warn about scam addresses; accounting tools match clean payments. The messy direct payments are left.†

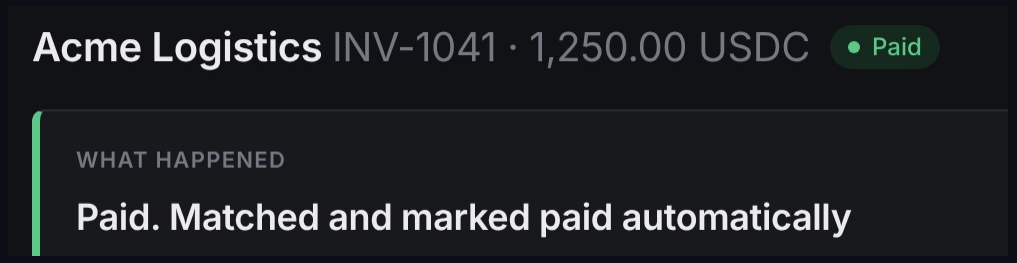

Stripe: docs.stripe.com · HitPay: fintechnews.sg · wallets and accounting tools: sources in the speaker notes.
◦ estimate † my belief, not yet proven

# Clearline: a smart cashier for digital-dollar payments

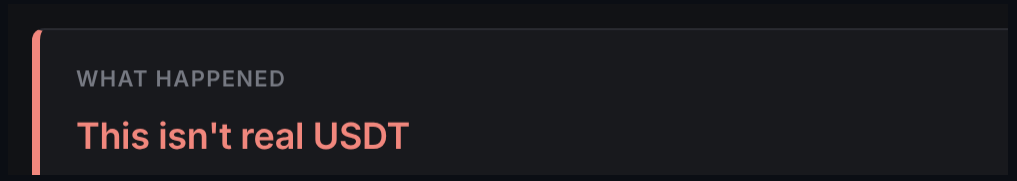

① **The customer sees exactly how to pay**

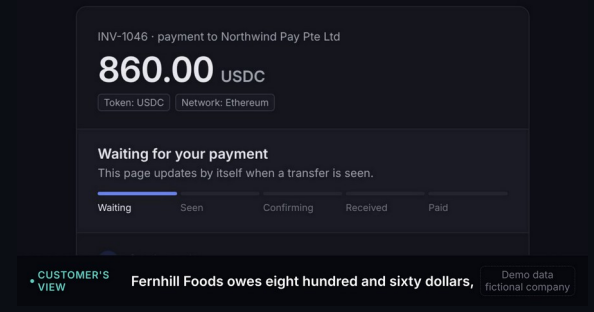

② **Correct payments tick themselves off**

③ **A problem is explained, with the reply drafted**

▶️ **60-second demo**

Scan to watch

Real screenshots of the working app. All demo data is fictional. It reads payments only; it never holds or moves money.

# It works in a demo. I don't yet know if people need it

## What works

- 7 payment situations work end to end
- 52 of 52 real transactions: correct verdict[1]

## What I don't know yet

- Do customers pay directly, or via checkout?
- Would finance teams use it?
- 0 customers; my 3 calls reached vendors only

[1] Real transactions it hadn't seen before (demo/REPORT.md). The invoice-matching part is not yet tested on real data.

# Three questions I'd love your view on

1. **Does the direct-payment gap seem real to you?**
2. **What would you test first?**
3. **Is there anyone you'd suggest I speak to?**

**Thank you for reading.**

Happy to show the demo in 15 minutes.
